January 2018

# Balance Between Paralyzing Technophobia and Blindness to Big Picture Consequences

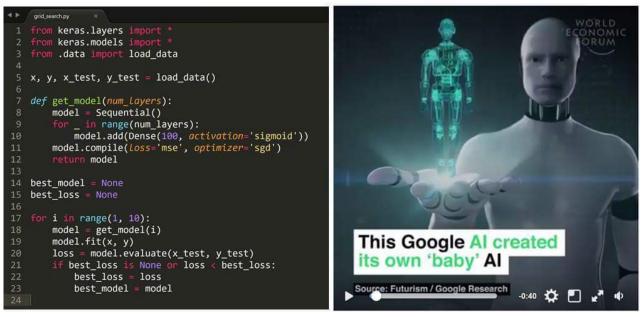

- Defining metric of disagreement is an **engineering question**: How hard is to create human-level artificial intelligence?
  - Can we build intuition about this without knowing how to build it?

## **MIT AGI Mission:** Engineer Intelligence

- **Goal 1:** Avoid the pitfalls of "black box" futurism thinking that results in hype that is detached from scientific understanding
- Goal 2: Avoid the pitfalls of "I'm just a scientist" that results in ignorance to near-term negative consequences that are preventable with good engineering

# Is the Singularity near?

- What drives humans to explore the unknown?
  - "For all the different forms it takes in different historical periods, for all the worthy and unworthy motives that lie behind it, exploration—travel for the sake of discovery and adventure—is a human compulsion, a human obsession even; it is a defining element of a distinctly human identity, and it will never rest at any frontier, whether terrestrial or extra-terrestrial."
    - Stewart Weaver, Exploration: A Very Short Introduction

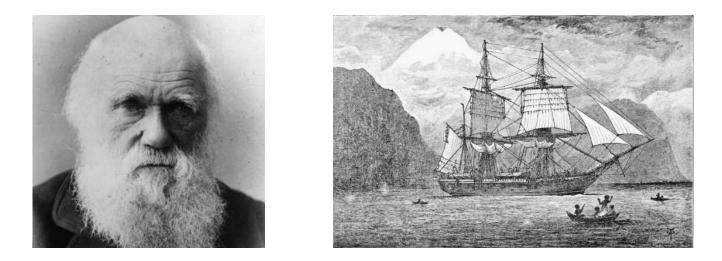

**Pytheas of Massalia, 325 B.C.E.** 7,500 miles of ocean travel for first known reporter of the Arctic

Zheng He, 1405-1433 China's imperial expeditions. Treasure voyages. 7 expeditions. First had 287 vessels and 27,780 men.

Christopher Columbus, 1492 Paved the way for European colonization of Americas. PS1: Didn't "discover" Americas. PS2: His approach receives harsh criticism modern scholarship.

"Thus, from the war of nature, from famine and death, the most exalted object which we are capable of conceiving, namely, the production of the higher animals, directly follows. ... Whilst this planet has gone cycling on according to the fixed law of gravity, from so simple a beginning endless forms most beautiful and most wonderful have been, and are being, evolved."

Charles Darwin's Voyage of the Beagle (sailed in 1831)

### "The Earth is blue ... it is amazing," Yuri Gagarin, first human in space (April 12, 1961).

# Lectures and Guest Talks

Lecture Mon, Jan 22, 7pm Room 54-100 Artificial General Intelligence [Slides]-[Lecture Video] (Available Soon)

Guest Talk Tue, Jan 23, 7pm Room 54-100 Josh Tenenbaum: Computational Cognitive Science Professor, MIT

Guest Talk Wed, Jan 24, 1pm Room 10-250 Ray Kurzweil: How to Create a Mind Google

Guest Talk Thu, Jan 25, 7pm Room 54-100 Lisa Feldman Barrett: Emotion Creation Northeastern University

Guest Talk Fri, Jan 26, 7pm Room 54-100 Nate Derbinsky: Cognitive Modeling Northeastern University

Guest Talk Mon, Jan 29, 1:30pm Room 26-100 Andrej Karpathy: Deep Learning Director of Al, Tesla Previously: OpenAl, Stanford University

Guest Talk Mon, Jan 29, 7pm Room 54-100 Stephen Wolfram: Knowledge-Based Programming Wolfram Research

Guest Talk Tue, Jan 30, 7pm <u>Room 54-100</u> Richard Moyes: Al Safety and Autonomous Weapon Systems Co-Founder and Managing Director, Article36

Guest Talk Wed, Jan 31, 7pm Room 54-100 Marc Raibert: Robotics CEO, Boston Dynamics Previously: MIT

Guest Talk Thu, Feb 1, 7pm Room 54-100 Ilya Sutskever: Deep Reinforcement Learning Co-founder, OpenAl Previously: Google Brain, Stanford, U of Toronto

 Lecture
 Fri, Feb 2, 7pm
 Room 54-100

 Human-Centered Artificial Intelligence
 [Slides] - [Lecture Video]
 (Available Soon)

### Josh Tenenbaum, MIT Computational Cognitive Science Tue, Jan 23, 7pm (Room 54-100)

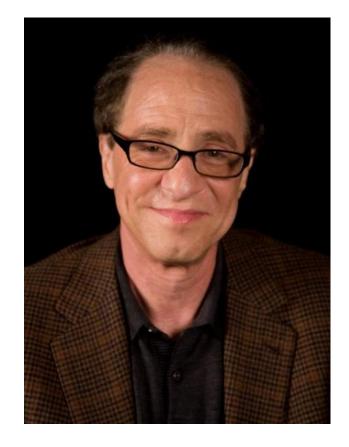

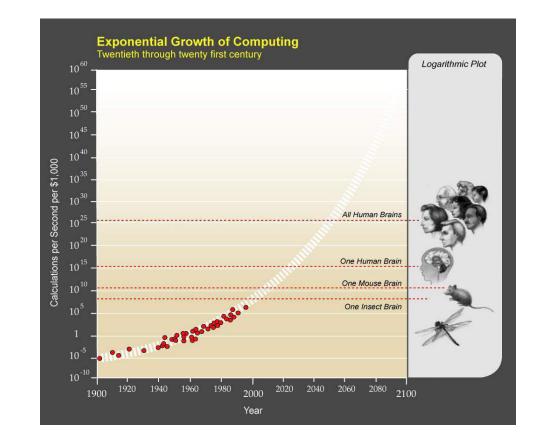

- Common sense understanding: How can we see a world of physical objects, their interactions and our own possibilities to act and interact with others ("intuitive physics") not simply classify patterns in pixels?
- Rapid model-based learning: How can we learning new concepts from so little experience often just a single example?
- Integrating best ideas of how to think about intelligence computationally:
  - Probabilistic generative models
  - Symbol-processing architectures
  - Neural networks

# Deep Learning:

#### Our intuition about what's "hard" is flawed (in complicated ways)

"Encoded in the large, highly evolve sensory and motor portions of the human brain is a **billion years of experience** about the nature of the world and how to survive in it.... Abstract thought, though, is a new trick, perhaps less than **100 thousand years** old. We have not yet mastered it. It is not all that intrinsically difficult; it just seems so when we do it." - Hans Moravec, Mind Children (1988)

Visual perception:540,000,000 years of dataBipedal movement:230,000,000 years of dataAbstract thought:100,000 years of data

Prediction: Dog

+ Distortion

Prediction: Ostrich

# **Neuron:** Biological Inspiration for Computation

• Neuron: computational building block for the brain

 (Artificial) Neuron: computational building block for the "neural network"

#### Differences (among others):

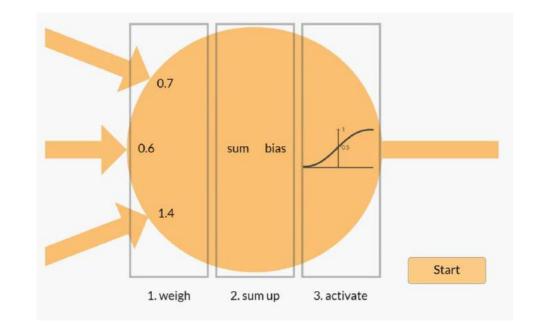

- **Parameters:** Human brains have ~10,000,000 times synapses than artificial neural networks.
- **Topology:** Human brains have no "layers". Topology is complicated.
- **Async:** The human brain works asynchronously, ANNs work synchronously.
- Learning algorithm: ANNs use gradient descent for learning. Human brains use ... (we don't know)
- **Processing speed**: Single biological neurons are slow, while standard neurons in ANNs are fast.
- **Power consumption:** Biological neural networks use very little power compared to artificial networks
- Stages: Biological networks usually don't stop / start learning. ANNs have different fitting (train) and prediction (evaluate) phases.

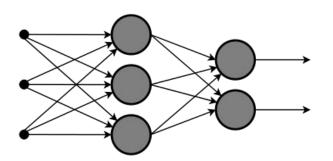

#### Similarity (among others):

• Distributed computation on a large scale.

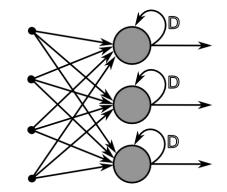

## **Artificial Neurons**

Feed Forward Neural Network

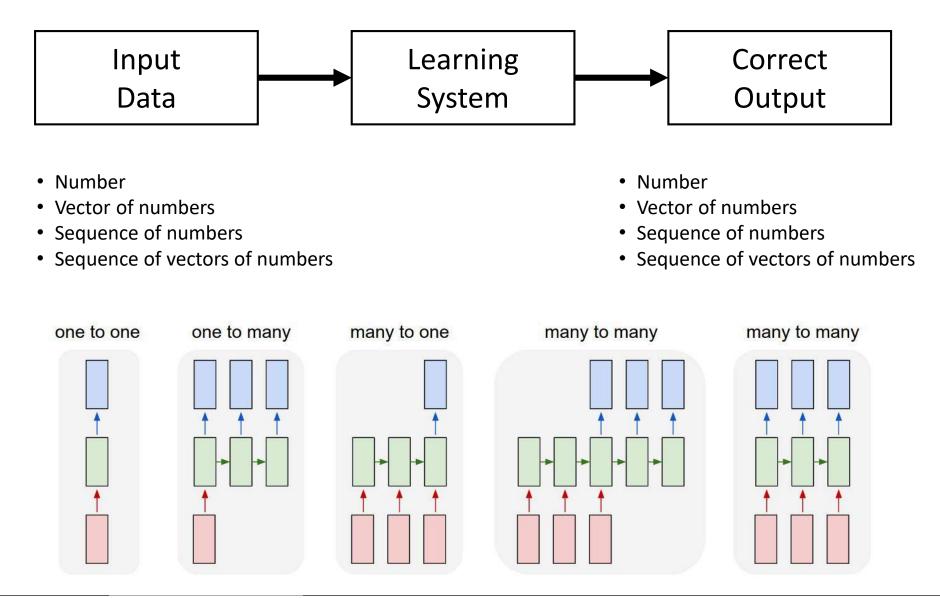

#### **Recurrent Neural Network**

# Past and Future of Deep Learning Breakthroughs

#### Microprocessor Transistor Counts 1971-2011 & Moore's Law

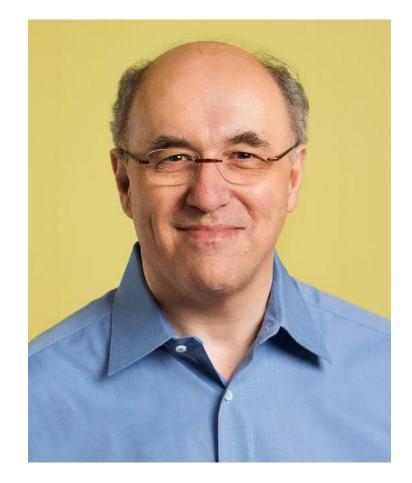

- Compute CPUs, GPUs, ASICs
- Organized large(-ish) datasets Imagenet
- Algorithms and research: Backprop, CNN, LSTM
- Software and Infrastructure Git, ROS, PR2, AWS, Amazon Mechanical Turk, TensorFlow, ...
- Financial backing of large companies Google, Facebook, Amazon, ...

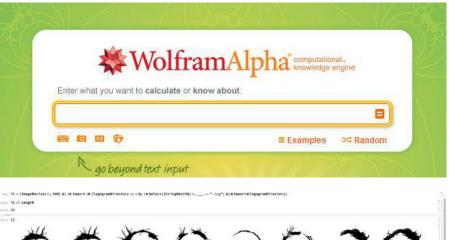

# **Current Challenges**

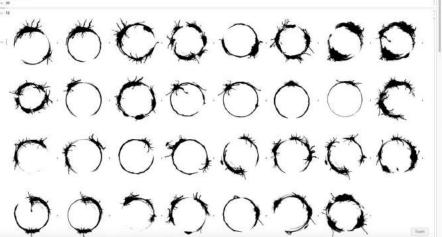

- **Transfer learning:** Unable to transfer representation to most reasonably related domains except in specialized formulations.
  - Understanding: Lacks "reasoning" or ability to truly derive "understanding" as previously defined on anything but specialized problem formulations. (Definition used: Ability to turn complex information to into simple, useful information.)
- Requires **big** data: inefficient at learning from data
- Requires **supervised** data: costly to annotate real-world data
- Not fully automated: Needs hyperparameter tuning for training: learning rate, loss function, mini-batch size, training iterations, momentum, optimizer selection, etc.
- **Reward:** Defining a good reward function is difficult.
- **Transparency:** Neural networks are for the most part black boxes (for realworld applications) even with tools that visualize various aspects of their operation.
- Edge cases: Deep learning is not good at dealing with edge cases.
